**Improved Representation of the Self-Perception Profile for Children through Bifactor
Exploratory Structural Equation Modeling**

Table S1

Standardized Factor Loading for the First-Order CFA and Bifactor-CFA Models

Item	Label		CFA	Bifactor-CFA	Residual		
			Loading	Residual			
Global Self-Concept							
5	Some kids are often unhappy with themselves. But other kids are pretty pleased with themselves.		0.668**	0.554**	0.688**	0.281**	0.448**
10	Some kids don't like the way they are leading their life. But other kids do like the way they are leading their life.		0.574**	0.670**	0.579**	0.198*	0.625**
15	Some kids are usually happy with themselves as a person. But other kids are often not happy with themselves.		0.745**	0.445**	0.733**	0.001	0.463**
20	Some kids like the kind of person they are. But other kids often wish they were someone else.		0.661**	0.564**	0.651**	-0.190**	0.540**
25	Some kids are very happy being the way they are. But other kids wish they were different.		0.755**	0.430**	0.763**	-0.289**	0.334**
30	Some kids are not happy with the way they do a lot of things. But other kids think the way they do things is fine.		0.590**	0.652**	0.589**	0.048	0.651**
Scholastic Competence							
1	Some kids feel that they are very good at their schoolwork. But other kids worry about whether they can do the schoolwork assigned to them.		0.558**	0.689**	0.343**	0.435**	0.693**
6	Some kids feel like they are just as smart as other kids their age. But other kids aren't so sure and wonder if they are as smart.		0.647**	0.581**	0.402**	0.497**	0.592**
11	Some kids are pretty slow in finishing their schoolwork. But other kids can do their schoolwork quickly.		0.604**	0.635**	0.279**	0.553**	0.617**
16	Some kids often forget what they learn. But other kids remember thinks easily.		0.604**	0.635**	0.345**	0.495**	0.635**
21	Some kids do very well at their classwork. But other kids don't do well at their classwork.		0.681**	0.536**	0.353**	0.592**	0.525**
26	Some kids have trouble figuring out the answers in school. But other kids can almost always figure out the answers.		0.685**	0.531**	0.379**	0.571**	0.530**
Peer Acceptance							
2	Some kids find it hard to make friends. But other kids fit it pretty easy to make friends.		0.637**	0.594**	0.345**	0.543**	0.587**
7	Some kids have a lot of friends. But other kids don't have very many friends.		0.732**	0.464**	0.371**	0.652**	0.437**
12	Some kids would like to have a lot more friends. But other kids have as many friends as they want.		0.689**	0.525**	0.389**	0.574**	0.520**
17	Some kids are always doing things with a lot of kids. But other kids usually do things by themselves.		0.536**	0.713**	0.318**	0.426**	0.717**
22	Some kids wish that more people their age liked them. But other kids feel that most people their age do like them.		0.660**	0.564**	0.418**	0.505**	0.570**
27	Some kids are popular with others their age. But other kids are not very popular.		0.696**	0.515**	0.439**	0.525**	0.532**

Table S1 (Continued)

Item	Label	CFA			Bifactor-CFA	
		Loading	Residual	G-Factor	S-Factor	Residual
Athletic Competence						
3	Some kids do very well at all kinds of sports. But other kids don't feel that they are very good when it comes to sports.	0.768**	0.411**	0.315**	0.726**	0.374**
8	Some kids wish they could be a lot better at sports. But other kids feel they are good enough at sports.	0.647**	0.581**	0.357**	0.530**	0.592**
13	Some kids think they could do well at just about any new sports activities they haven't tried before. But other kids are afraid they might not do well at sports they haven't ever tried.	0.741**	0.450**	0.367**	0.643**	0.452**
18	Some kids feel that they are better than others their age at sports. But other kids don't feel they can play at well.	0.675**	0.544**	0.290**	0.624**	0.526**
23	In games and sports some kids usually watch instead of play. But other kids usually play rather than watch.	0.352**	0.876**	0.269**	0.228**	0.876**
28	Some kids don't do well at new outdoor games. But other kids are good at new games right away.	0.564**	0.682**	0.356**	0.425**	0.693**
Physical Appearance						
4	Some kids are happy with the way they look. But other kids are not happy with the way they look.	0.706**	0.502**	0.617**	0.285**	0.538**
9	Some kids are happy with their height and weight. But other kids wish their height or weight were different.	0.544**	0.705**	0.431**	0.355**	0.688**
14	Some kids wish their body was different. But other kids like their body the way it is.	0.702**	0.506**	0.551**	0.494**	0.453**
19	Some kids wish their physical appearance (how they look) was different. But other kids like their physical appearance the way it is.	0.802**	0.357**	0.639**	0.545**	0.294**
24	Some kids wish that something about their face or hair looked different. But other kids like their face and hair the way it is.	0.633**	0.599**	0.560**	0.290**	0.602**
29	Some kids think they are good looking. But other kids think that they are not good looking.	0.698**	0.512**	0.635**	0.235**	0.541**

Note. * $p < .05$. ** $p < .01$.

Table S5

Goodness-of-fit Indices of Models Excluding Global Self-Concept Items

Model	χ^2	df	CFI	TLI	RMSEA	RMSEA 90% CI	Model Description
CFA							
Model 1	1272.438	246	.926	.917	.042	[.040, .044]	First-order CFA
Model 2	1278.810	248	.926	.918	.042	[.040, .044]	Higher-order CFA
Model 3	1073.598	228	.939	.927	.040	[.037, .042]	Bifactor-CFA
ESEM							
Model 4	873.737	186	.951	.927	.040	[.037, .042]	First-order ESEM
Model 5	877.685	188	.950	.927	.039	[.037, .042]	Higher-order ESEM
Model 6	460.788	166	.979	.965	.027	[.025, .030]	Bifactor-ESEM
Invariance across gender and grade level							
Model 9	1073.488	664	.971	.952	.032	[.031, .036]	Configural invariance
Model 10	1398.140	949	.968	.963	.028	[.026, .031]	Weak invariance (loadings)
Model 11	1601.979	1006	.958	.954	.032	[.028, .033]	Strong invariance (loadings, intercepts)
Model 12	1822.270	1078	.948	.946	.034	[.030, .034]	Strict invariance (loadings, intercepts, uniq.)
Model 13	1967.458	1123	.940	.941	.036	[.031, .035]	Full invariance (loadings, intercepts, uniq., var./covar.)
Model 14	2216.761	1138	.924	.926	.040	[.034, .039]	Latent mean invariance (loadings, intercepts, uniq., var./covar., means)

Note. CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation; CI = confidence interval; GSC: Global self-concept; uniq. = uniquenesses; var./covar. = latent variances and covariances. ESEM models were conducted with target oblique rotation. All models were conducted with the MLR estimator. All χ^2 values are all significant ($p < .01$).

Table S6

Standardized Factor Loading of the First-Order ESEM, First-order CFA, and Bifactor-CFA Models Excluding Global Self-Concept Items

Item	ESEM				CFA			Bifactor-CFA		
	Scholastic	Appearance	Athletic	Peer	Residual	Loading	Residual	G-Factor	S-Factor	Residual

Complementary Tests of Measurement Invariance across Single Grouping Variables

Before conducting the invariance models across four groups of students (i.e., based on students' grade level (elementary school vs. secondary school x gender), we tested for invariance across grade level and gender separately. In short, these results supported the measurement invariance (i.e., weak, strong, and strict measurement invariance) as well as the invariance of factor variances and covariances across grade levels (Models S1 to S5 in Table S9) and gender (Models S7 to S11 in Table S9). The observed changes in the fit indices also suggested that the latent means may also be invariant across grade levels and gender. However, in both cases, these changes remained well over the changes observed at other steps of the sequence of invariance testing and the changes in chi-square values also proved to be quite elevated (for grade level: $\Delta\text{MLR}\chi^2 = 89.636$, $\Delta\text{df} = 6$; for gender: $\Delta\text{MLR}\chi^2 = 157.793$, $\Delta\text{df} = 6$). We thus considered Models S5 and S11 where the mean levels for one group serving as the reference group (Model S5: elementary school students; Model S11: boys) were fixed to zero for identification purposes. Thus, the latent means in the other group (secondary school students in Model S5; boys in Model S11), are expressed as deviations from the latent means of the first (reference group) in SD units. According to the results from Model S5, the secondary students displayed significantly lower latent means on the G-factor (-0.283, $p < .01$) and on the S-factors representing scholastic competence (-0.218, $p < .01$), peer acceptance (0.371, $p < .01$), and physical appearance (-0.193, $p < .01$). Elementary and secondary school students did not differ in their latent mean levels on the athletic competence S-factor, and on the GSC S-factor. Model S11 showed that girls' latent means are lower than boys' on the G-factor (-0.374, $p < .01$) and on the S-factor for athletic competence (-0.377, $p < .01$). Conversely, girls' latent means on the S-factors for peer acceptance (0.306, $p < .01$) and GSC (0.359, $p < .01$) are significantly higher than boys'. No gender differences were apparent on the physical appearance and scholastic competence S-factors.

Table S9

Goodness-of-fit Indices of the Invariance Models across Grade Level and Gender Separately (B-ESEM, Model 7)

Model	χ^2	df	CFI	TLI	RMSEA	RMSEA 90% CI	Model Description
Invariance across Grade Levels							
Model S1	1032.718	540	.974	.958	.028	[.025, .030]	Configural invariance
Model S2	1190.314	684	.973	.966	.025	[.023, .027]	Weak invariance (loadings)
Model S3	1276.764	708	.970	.963	.026	[.024, .028]	Strong invariance (loadings, intercepts)
Model S4	1399.383	738	.965	.959	.028	[.025, .030]	Strict invariance (loadings, intercepts, uniquenesses)
Model S5	1443.306	759	.964	.959	.028	[.026, .030]	Full invariance (loadings, intercepts, uniquenesses, var./covar.)
Model S6	1532.942	765	.960	.954	.029	[.027, .031]	Latent mean invariance (loadings, intercepts, uniquenesses, var./covar., latent means)
Invariance across Gender							
Model S7	1052.696	540	.973	.956	.028	[.026, .031]	Configural invariance
Model S8	1230.685	684	.971	.963	.026	[.024, .028]	Weak invariance (loadings)
Model S9	1319.595	708	.968	.960	.027	[.025, .029]	Strong invariance (loadings, intercepts)
Model S10	1388.556	738	.966	.959	.027	[.025, .030]	Strict invariance (loadings, intercepts, uniq.)
Model S11	1502.462	759	.961	.955	.029	[.027, .031]	Full invariance (loadings, intercepts, uniq., var./covar.)
Model S12	1660.255	765	.953	.946	.032	[.029, .034]	Latent mean invariance (loadings, intercepts, uniq., var./covar., latent means)

Note. CFI = comparative fit index; TLI = Tucker-Lewis index; RMSEA = root mean square error of approximation; CI = confidence interval; uniq. = uniquenesses; var./covar. = latent variances and covariances. ESEM models were conducted with target oblique rotation. All models were conducted with the MLR estimator. All χ^2 values are all significant ($p < .01$).

Title: Hierarchical-ESEM (Model 6 in Table 1 of the main manuscript)

! Model section only, the other sections are identical to the one for the CFA model
! The previous ESEM model is re-expressed using CFA. No rotation is necessary.
! The model section uses the exact values of the non-standardized loadings and cross-
*! loadings estimated from the previous model as starts values (using *). For identification*
! purposes, factor variances are constrained to be 1 (f1-f3@1;) and one item per factor has
! all cross-loadings on non-target factors constrained to be exactly equal to their ESEM
! values (using @).
! These first-order factors define a higher-order factor.

Title: Bifactor-ESEM (including the GSC S-factor; Model 7 in Table 1 of the main manuscript)

! Model and analysis sections only, the other sections are identical to previous models

! Specification of orthogonal bifactor target rotation

ANALYSIS:

ESTIMATOR = MLR;

ROTATION = TARGET (orthogonal);

MODEL:

! S-factors are defined as in the ESEM model.

! G-factor is defined from all items, with all loadings freely estimated.

*! All factors within a single set of ESEM factors (*1).*

! Cross-loadings are “targeted” (~) to be as close to 0 as possible (~0)

Title: Configural Invariance of the Bifactor-ESEM**VARIABLE:**

! [...]
 ! the grouping function is added to the Variable section to define the groups based on grade
 ! level (elementary and secondary school students) and gender (boys and girls); the respective
 ! labels for the groups (1, 2, 3, ! 4) must appear in the data set.
 grouping = group (1=1 2=2 3=3 4=4);
 ! 1 = elementary school boys; 2 = elementary school girls
 ! 3 = secondary school boys; 4 = secondary school girls

ANALYSIS:

ESTIMATOR = MLR;

ROTATION = TARGET (orthogonal);

MODEL:

! see model specification for the bifactor-ESEM model (including the GSC S-factor) for the
 ! total group this model is estimated separately in each group
 ! the first section of input refers to Group 1 (elementary school boys)
 ! Factor loadings and cross-loadings are freely estimated in all groups. In this context,
 ! Mplus fixes the factor variance to be 1 in all groups. Uniquenesses are freely estimated in
 ! all groups by default.

Title: Invariance of Factor Loadings of the Bifactor-ESEM

! Model and analysis sections only, other identical to the previous invariance model

MODEL:

! In Mplus, the factor loadings are set to be invariant across groups by default. To estimate ! invariant factor loadings, one simply has to take out the statements related to factor ! loadings from the group-specific sections of the input. With invariant factor loadings, Mplus ! constrains the factor variances to be one in the first group, and freely estimated in the other ! groups. The rest of the input remains unchanged.

Title: Invariance of Factor Loadings, Item Intercepts, Item Uniquenesses, and Factor Variances/Covariances of the Bifactor-ESEM

! Model and analysis sections only, other sections identical to previous invariance model
MODEL:

! In this model, the default which constraints the factor variances to be freely estimated in all groups save for the first one have to be turned off by fixing back the factor variances to be equal to 1 (@1) in all of the remaining groups. Factor correlations are also specified and constrained to equality using labels in parentheses. Even though the rotation used here is still orthogonal, equality constraints need to be imposed on the unrotated factor correlations to be able to test the complete invariance the latent variance-covariance matrix.

Title: Invariance of Factor Loadings, Item Intercepts, Item Uniquenesses, Factor Variances/Covariances, and Factor Means of the Bifactor-ESEM

! Model and analysis sections only, other sections identical to the previous invariance model
MODEL:

! In this model, the default which constraints the factor means to be freely estimated in all groups save for the first one have to be turned off by fixing back the factor means to be equal to 0 (@0) in all of the remaining groups.
